

### **XIII. Phanerozoic - Middle Paleozoic (chapter 14)**

#### **A. Introduction - Middle Paleozoic = Silurian & Devonian**

#### **B. S-D Paleogeography & PT (pp. 331, 345-354)**

##### **1. Locations & movements of continents**

**a. Laurentia**

**b. Baltica**

**c. Siberia**

**d. Gondwana**

##### **2. Taconic Orogeny finishes up**

##### **3. Acadian Orogeny (Avalon collided with Laurentia)**

##### **4. Caledonian Orogeny (Baltica collided with Laurentia)**

##### **5. Laurussia (= Euramerica) (= Old Red Sandstone Continent)**

##### **6. Antler Orogeny (western North America)**

#### **C. Sea level & climate (pp. 331, 345-347)**

##### **1. High sea level, but lower than in the Ordovician**

**2. Major regression in Early Devonian**

**3. ~Warm in Silurian-Devonian**

**4. Late Devonian glaciation**

**D. Some S & D rocks (pp. 345-354)**

**1. Widespread Silurian limestone/dolostone/reef/evaporite deposits**

**2. Major unconformity in N.Am. & clean sandstone usu. just above**

**3. Devonian fossiliferous limestones common**

**4. Catskill Delta**

**5. After orogenies, lots of black shales (~globally)**

**E. S & D life/fossils (pp. 64-67, 330, 332-345, 348-349)**

**1. After end-Ordovician extinction → big adaptive radiation**

**2. Silurian = “Age of Corals” & Devonian = “Age of Fishes”**

**3. Widespread S-D reefs**

**a. Reef builders - tabulate & rugose corals, stromatoporoids**

**b. Reef & inter-reef dwellers - brachiopods, bryozoans, crinoids, trilobites, molluscs**

**4. Nektic animals**

**a. Eurypterids**

**b. Ammonoid cephalopods**

**c. Jawless Fish**

**d. 1<sup>st</sup> Jawed Fish (O - not important until D)**

**i. Origin & history of vertebrates**

**a) Characteristics of Phylum Chordata**

**b) Echinoderm origins?**

**c) Tunicates (Subphylum Urochordata)**

**d) Lancelet (Subphylum Cephalochordata)**

**e) Vertebrates (Subphylum Vertebrata)**

**f) Earliest chordate & vertebrate fossils**

**i) Chengjiang & Burgess Shale**

**ii) 1<sup>st</sup> vertebrate bone in Late Cambrian**

**iii) Conodonts**

**ii. 1<sup>st</sup> jaws & 1<sup>st</sup> scales**

**iii. 1<sup>st</sup> acanthodians**

**iv. 1<sup>st</sup> placoderms (mostly predators)**

**v. 1<sup>st</sup> bony fish**

**vi . 1<sup>st</sup> sharks (no bones) & 1<sup>st</sup> lungfish in Devonian**

**5. 1<sup>st</sup> land plant body fossils (S) & 1<sup>st</sup> forests (D)**

**a. Land plants evolved from freshwater green algae**

**b. Vascular tissues provide support, transport nutrients & water**

**c. ~10 m tall trees in forests in Late Devonian**

**6. 1<sup>st</sup> land animals**

**a. 1<sup>st</sup> land invertebrates (Silurian) (C-O ?)**

**b. 1<sup>st</sup> amphibians (1<sup>st</sup> tetrapods) (Late Devonian)**

**i. Evolved from rhipidistian bony fish**

**ii. *Eusthenopteron***

## ***Tiktaalik***

### ***Panderichthys-Acanthostega-Ichthyostega***

#### **iii. Why move to land?**

- a) Drought**
- b) Food resources**
- c) Escape from predators**
- d) Better eyesight**

#### **iv. Anatomy & problems with life on land**

- a) Breathing air (need lungs)**

- b) 3-chambered heart**

- c) Desiccation**

- d) Reproduction**

- e) Mobility**

- f) Support (stronger backbones, stouter limbs, stronger shoulder/pelvic girdles)**

- g) Need access to water**

- h) Sensing the environment**

**7. Important lagerstätten**  
**a. Hunsrück Slate (Dev.)**

**b. Rhynie Chert (Dev.)**

**8. Frasnian-Famennian mass extinction (pp. 348-349)**

**a. Hit reef-builders hard**

**b. Cause(s)?**
